About This Webinar

The (field-emitted confocal optical coherence tomography, OCCT) is an imaging technique based on the combination of confocal microscopy and fiber-optic technology. OCCT can generate cellular-resolution vertical images, tissue-contrast images, and three-dimensional images, offering promising applications in the fields of clinical diagnostic and research. The recent advancements in this field make it possible to provide a new perspective for the study and management of skin cancer. In particular, this Webinar will introduce the latest OCCT advances that enable a better understanding of skin cancer and offer a new diagnosis and management tool.

The Webinar will cover:
- Introduction to OCCT
- Advancements in OCCT
- Applications in skin cancer research and management
- Future directions and opportunities
